

Route Operations Dashboard v1.1

Easy User Guide

A simple step-by-step walkthrough of the core Route Operations Dashboard screens, using fictional example company data.

Start here

1. Work through the guide in order the first time.
2. Your own figures will differ from the fictional example figures shown here.
3. Do not upload real customer or personal data to a public website demo.
4. Advanced tools such as File Mapping, Recalculation and Scenario Analysis are used only when needed.

Normal daily route: Dashboard > Drivers (if needed) > Daily Operations > Issues & Review > Reports & Analysis

Dashboard Overview

See the day's operational picture at a glance

The Dashboard is the first place to look. It summarises the selected period, shows the main operational totals and gives a quick financial view.

Follow these steps

- 1 Choose the source**
Use Carrier / contract source to view one source or leave it on All Sources.
- 2 Choose the period**
Select the Dashboard period you want to review.
- 3 Read the operational cards**
Check drivers in view, imported records, completed stops and anything open for review.
- 4 Read the financial cards**
Check calculated driver pay, source revenue, estimated contribution and average stops per route.

What this page is for

Quick status check

See the main operational position without opening every section.

Open / Review

Anything needing attention is surfaced before you move on.

Contribution is an estimate

The figure shown is not final profit unless all operating costs are configured.

NOTE Your figures will be different because they depend on the selected period and your imported data.

Dashboard Activity & Daily Totals

Understand what is driving the headline figures

Scroll down the Dashboard to see daily activity, the highest-volume drivers and the daily totals behind the summary cards.

Follow these steps

- 1 Check completed stops by day**
Use the line chart to spot changes in activity across the selected period.
- 2 Check top drivers**
The driver chart shows who recorded the most completed stops.
- 3 Read the daily totals**
Use the table to confirm daily stops, driver net pay and source revenue.
- 4 Confirm the active profile**
The left panel shows which example company and contract profile is active.

What this page is for

See movement by day

Useful for spotting unusually busy or quiet days.

See driver activity

Quickly compare completed-stop volume across drivers.

Verify the numbers

The daily table gives the detail behind the charts.

Driver Management

Keep the driver register current without losing history

Use Driver Management for day-to-day driver administration. Drivers who leave should normally be marked as Left rather than deleted so historic records remain intact.

Follow these steps

- 1 Check the summary cards**
See active, inactive, left / leaver and total driver record counts.
- 2 Choose what to show**
Use the Show filter to view Active drivers or another status.
- 3 Review the driver register**
Check driver ID, name, status, pay / contract profile, carrier, dates and vehicle.
- 4 Keep leavers as history**
Use Mark Driver as Left when someone leaves instead of deleting their record.

What this page is for

One driver register
Keeps the current team and historical leavers in the same controlled record.

Contract awareness
Each driver can be linked to the correct pay / contract profile.

Audit continuity
Historical pay and reporting remain available when a driver leaves.

Add New Driver

Add a new driver before entering daily work

The Add New Driver tab creates a new driver record. The dashboard assigns the internal driver ID automatically.

Follow these steps

- 1 Open Drivers > Add New Driver**
Choose the Add New Driver tab at the top of Driver Management.
- 2 Enter the main details**
Add the driver name, status, pay / contract profile and start date.
- 3 Add optional details**
Vehicle, registration, own-van status, phone, email and notes can be completed as required.
- 4 Click Add Driver**
Save the record, then use Edit Driver later if any details change.

What this page is for

Automatic internal ID

The dashboard assigns the internal driver ID for you.

Correct pay profile matters

Choose the right profile because it affects later pay calculations.

Keep details editable

Use Edit Driver for changes and Mark Driver as Left for leavers.

Daily Operations

Use this as the normal day-to-day workspace

Daily Operations is where the working day is entered and reviewed. Set the work date, record who worked, enter routes and stops, then review dashboard calculations before saving.

Follow these steps

- 1 Set the work date**
Confirm the date you are entering before touching the worksheet.
- 2 Use Daily Entry**
The Daily Entry tab is the normal place to enter today's work.
- 3 Check the day summary**
Active drivers, already saved, saved stops and saved net pay show the day's current state.
- 4 Scroll to the worksheet**
The Daily worksheet contains one row for each active driver.

What this page is for

Normal daily workspace

Designed to replace repeated spreadsheet entry.

Saved-day visibility

You can see whether the selected date has already been saved.

Historical imports stay separate

Imported historic data is kept separate from the live daily-entry workflow.

Daily Worksheet

Record who worked and what they completed

The worksheet is deliberately spreadsheet-like, but the dashboard controls the calculations. Each active driver appears as a row.

Follow these steps

- 1 Tick Worked**
Tick the Worked box only for drivers who worked on the selected date.
- 2 Enter route and stops**
Add the route and completed stops for each working driver.
- 3 Check vehicle / own van**
Confirm vehicle details and the Own Van box where relevant.
- 4 Add a note if needed**
Use Notes for useful operational context, then continue to the calculation and save stage.

What this page is for

Only working drivers count

At least one driver must be marked Worked before a calculation can be built.

Consistent daily entry

The same controlled structure is used for every driver.

The dashboard does the maths

The worksheet captures inputs; the dashboard applies the configured rules.

Driver Pay Review

Check calculated pay before treating it as complete

Driver Pay shows calculated pay records from operational data. Use the filters and status column to review the results before relying on them.

2026-08-21	Sam Carter	Example Delivery Contract Example Parcel Network Parcel Network A	Name	63	£180.00	£2.50	£177.50	CLEAR
2026-08-21	Taylor Reed	Example Delivery Contract Example Parcel Network Parcel Network A	Name	68	£190.00	£2.50	£187.50	CLEAR

Follow these steps

- 1

Use the filters
Filter by source, date, driver or status to find the records you need.
- 2

Check the summary
Review gross pay, deductions, net pay and any records under review.
- 3

Check each row
Confirm stops, gross pay, deductions, net pay and status for the driver.
- 4

Investigate anything under review
Open Issues & Review if a record is not clear.

What this page is for

Pay is traceable

Each result stays linked to its date, driver and source.

Deductions are visible

Gross, deduction and net figures are separated.

Review status matters

Do not ignore records shown as under review.

Smart Import

Start with the files the business already uses

Smart Import is the recommended starting point when bringing existing business files into the dashboard. Upload the files and let the system identify what it can use.

Follow these steps

- 1 Open Import Data > Smart Import**
Choose Smart Import from the Import workspace dropdown.
- 2 Upload the business files**
Add one or more supported Excel, CSV or ODS files.
- 3 Let the dashboard analyse them**
The system looks for likely operational, onboarding or commercial data.
- 4 Review what was found**
Keep useful data and move to mapping only when the file layout needs more control.

What this page is for

Recognise likely data
The dashboard tries to identify what each file contains.

Explain the result
The import flow shows what was found and what may be missing.

Mapping is the fallback
Use File Mapping for layouts that cannot be recognised safely.

PUBLIC DEMO Do not upload real customer or personal data to the public website demo.

Customer Onboarding

Start with partial information and complete it later

Customer Onboarding lets you retain useful partial information instead of waiting for a perfect spreadsheet. The example shows Driver Name as the required identity field for a staged row.

Follow these steps

- 1 Choose Customer Onboarding**
Select it from the Import workspace dropdown.
- 2 Use Add Manually**
Enter whatever is currently known about the driver or work record.
- 3 Save the partial record**
Fields can be left blank where the information is not yet available.
- 4 Complete it later**
Use Import Partial Spreadsheet or Complete Staged Data when more information becomes available.

What this page is for

Partial data is useful

You do not need to reject a whole record because some details are missing.

Staged records stay separate

Incomplete records can be held until they are ready for operations.

Finish later

Missing dates, stops, route, vehicle or contact details can be added afterwards.

File Mapping

Create a reusable map for a carrier file layout

File Mapping is used when a carrier spreadsheet needs its columns mapped into the dashboard structure. Saving a mapping is a preview/configuration step and does not itself import live operational records.

Follow these steps

- 1 Choose File Mapping**
Select the correct contract / profile first.
- 2 Confirm the carrier label**
Check the mapping carrier / customer label shown on screen.
- 3 Upload a sample file**
Use a CSV or Excel sample so the dashboard can inspect the layout.
- 4 Review and save the mapping**
Once correct, save it so the same file layout can be validated and reused later.

What this page is for

Standardise carrier files
Different spreadsheet layouts can map into the same dashboard structure.

Reusable setup
A saved mapping avoids rebuilding the same column mapping every time.

Preview before live import
Mapping lets you check the structure before operational data is accepted.

Controlled Carrier Import

Validate before data reaches live operations

Controlled Carrier Import is for validated carrier files. Use Sandbox / Test first when you want to check a file without changing live operations.

Follow these steps

- 1 Choose Advanced Controlled Import**
Open it from the Import workspace dropdown.
- 2 Choose Sandbox / Test or Live Import**
Use Sandbox / Test first when validating a new or changed file.
- 3 Confirm a mapping exists**
Create and save an Import Mapping before using the controlled import flow.
- 4 Proceed only after checks pass**
Use Live Import only when you are satisfied that the file and mapping are correct.

What this page is for

Safe testing

Sandbox records the test batch separately.

Protect live data

Sandbox does not change dashboard totals, driver pay, reports or historical records.

Controlled acceptance

Live import follows validation rather than accepting unverified files.

NOTE For a first-time user, stay in Sandbox / Test until the file has been checked.

Exception Centre

Find and review operational exceptions

The Exception Centre brings unusual or flagged operational records into one place. Use the filters to narrow the list and then select the record you want to review.

Follow these steps

- 1 Choose Issues & Review > Exceptions**
Open Exceptions from the Review workspace dropdown.
- 2 Use the filters**
Filter by severity, driver, status or source.
- 3 Read the status cards**
Open, Under Review, Resolved and Showing summarise the current list.
- 4 Select the exception**
Choose the record in Review exception to see the details and system reason.

What this page is for

One review queue
Exceptions are kept together rather than hidden in separate spreadsheets.

Clear status
You can see what is open, being reviewed or resolved.

Source traceability
Each exception stays linked to its driver, date and source.

Review an Exception

Record the decision and keep the audit trail

After selecting an exception, read the details and system note, record who reviewed it, choose the new status and save a review note.

Follow these steps

- 1 Confirm the selected exception**
Check the driver, date, category, source, status, import batch and severity.
- 2 Read the system note**
Understand why the dashboard created the exception before changing its status.
- 3 Enter the review outcome**
Complete Reviewed by, choose the new status and add a useful review note.
- 4 Save Exception Review**
Save the decision so the status and audit trail stay current.

What this page is for

Explain the decision

Review notes make later checks much easier.

Change status deliberately

Keep an exception Open until it has genuinely been dealt with.

Maintain an audit trail

The dashboard keeps the record of the review rather than overwriting the history.

Controlled Recalculation

Preview changes before historical records are updated

Controlled Recalculation lets you test proposed source-rate or driver-pay changes. Nothing changes until the recalculation is explicitly approved.

Follow these steps

- 1 Choose Recalculation**
Open it from the Review workspace dropdown.
- 2 Choose what to recalculate**
Tick source revenue, driver pay, or both.
- 3 Review the proposed source rate**
Check the proposed rate against the currently configured rate.
- 4 Review the pay-rule preview**
The rule table is a temporary copy for the preview, not a live Settings change.

What this page is for

Preview safely

You can inspect the effect before historical records are touched.

Validate logic

Useful when rates or pay bands are being changed.

Protect existing records

Previewing is safe and does not alter live or historical records.

NOTE Do not approve a recalculation until the preview has been checked carefully.

Recalculation Pay Rules

Check every pay band before building the preview

The lower part of the recalculation page shows the temporary driver-pay rule set that will be used for the preview.

Follow these steps

- 1 Read each pay band**
Check minimum drops, maximum drops, fixed pay and any extra-per-drop rule.
- 2 Check the top band**
Confirm the rule for 84+ drops or any other open-ended band.
- 3 Compare with the intended contract**
Make sure the temporary preview rules reflect the proposed change.
- 4 Build Recalculation Preview**
Generate the preview only after the proposed settings look correct.

What this page is for

Temporary rules

Editing this preview copy does not change Settings by itself.

Whole-rule check

Review every band, not only the one you intend to change.

Preview before approval

The preview is the safe checkpoint before any historical update.

Reports & Exports

Create management reports from operational data

Reports & Exports summarises the selected source and reporting period. It includes operational totals and driver-level results.

Follow these steps

- 1 Choose the report source**
Use All Sources or select the source you want to report on.
- 2 Choose the reporting period**
Select the week or other available reporting period.
- 3 Choose a report tab**
Summary, Daily Driver Pay and Exception Report provide different views.
- 4 Review the totals**
Check drivers, stops, driver net pay, source revenue and the driver totals table.

What this page is for

Management summary

A fast operational view for the selected period.

Driver detail

Totals stay linked to individual drivers.

Consistent filters

The same source and period control the report output.

Report Downloads

Export the selected report period

Scroll below the driver totals to export the selected source and period in useful formats.

Downloads

Download Daily CSV

Download Excel Report Pack

Download PDF Summary

Downloads contain only the selected source and reporting period. Management reports are for operational review and decision support; they are not statutory payroll documents.

Follow these steps

- 1

Confirm the driver totals
Review the table before exporting.
- 2

Download Daily CSV
Use CSV when you want row-based operational data.
- 3

Download Excel Report Pack
Use the Excel pack for a structured management workbook.
- 4

Download PDF Summary
Use the PDF option for a simple management summary.

What this page is for

- Same selected period**
Downloads use the report source and period already selected.
- Different output formats**
Choose the format that best suits review or sharing.
- Management use**
These are management reports, not statutory payroll documents.

Carrier Performance

Compare carrier activity and operational quality

Carrier Performance uses operational data and any customer-configured operating costs. It starts with no built-in financial assumptions.

Follow these steps

- 1 Choose the performance period**
Use All Time, This Week, This Month, Last 30 Days or a custom range.
- 2 Read the carrier comparison**
Check records, stops, driver net pay, source revenue and worked route-days.
- 3 Review the rankings**
Rankings summarise activity, cost measure, revenue and exception rate.
- 4 Use the selected period consistently**
All rankings and comparisons use the performance period shown.

What this page is for

Operational comparison

Compare carriers using the same underlying measures.

No hidden cost assumptions

Only costs configured for the customer are included.

Exception-rate context

Quality is shown alongside volume and financial measures.

Carrier Rankings & Period Comparison

Move from headline ranking to one carrier's detail

This section shows source-revenue and exception-rate rankings, then lets you focus on the selected carrier and period.

Follow these steps

- 1 Review ranking tables**
Check activity, pay, source revenue and exception-rate views.
- 2 Read the period message**
The dashboard will show whether an earlier equivalent period is available.
- 3 Choose the carrier / source**
Select the carrier you want to inspect in detail.
- 4 Read the carrier KPI cards**
Records, stops, pay, revenue, route-days, costs, open/review and linked profiles are shown together.

What this page is for

Same-period comparison

Rankings are based on the currently selected performance period.

Carrier detail

The KPI cards give one carrier's operating picture.

Context before conclusions

Use volume, pay, revenue and exceptions together rather than one number alone.

Operational Costs & Trends

Add cost context and read the activity charts

Operational Costs shows only customer-configured cost rules. The charts below compare completed stops and source revenue / driver net pay by day.

Follow these steps

- 1 Check configured costs**
Worked route-days and configured operational costs are shown first.
- 2 Read the cost message**
If no cost rules are configured, the dashboard makes that clear.
- 3 Review completed stops by day**
Use the chart to see activity movement over time.
- 4 Compare revenue and driver pay**
Use the second chart to see how source revenue and driver net pay move across the same days.

What this page is for

Transparent assumptions

No scanner, route, vehicle or other costs are invented by the dashboard.

Trend visibility

Charts make unusual days easier to spot.

Commercial context

Revenue and driver pay can be viewed together before deeper analysis.

Daily Performance & Linked Profiles

See the day-by-day detail behind carrier performance

Daily Performance lists the operational totals for each date and shows which profiles / contracts are linked to the selected carrier.

Follow these steps

- 1 Read the daily table**
Check records, stops, driver net pay and source revenue for each date.
- 2 Look for unusual days**
Use the detail to explain movements seen in the charts.
- 3 Check linked profiles / contracts**
Confirm company, depot, contract, source rate and mapping count.
- 4 Keep comparisons factual**
Use the data as operational evidence rather than a simple 'best' or 'worst' label.

What this page is for

Day-level evidence

Useful for checking why a total changed.

Contract linkage

See which profile and source rate sit behind the carrier.

Audit-friendly detail

The report stays tied to actual dates and configured profiles.

Scenario Analysis

Model proposed contract changes without touching live records

Scenario Analysis is a simulation workspace. You can test a proposed source rate, route changes, estimated stops and optional operating-cost assumptions without changing live settings.

Follow these steps

- 1 Enter proposed contract terms**
Set the source rate, additional routes, estimated stops and any extra cost assumption.
- 2 Choose optional cost treatment**
Include existing Van/Man cost only if that is appropriate for the scenario.
- 3 Review the copied pay rules**
Scenario pay rules are a copy for modelling; live settings remain untouched.
- 4 Scroll down before running**
Check the whole proposed rule table before starting the comparison.

What this page is for

Simulation only
Nothing entered here changes historical records or customer settings.

Model operational changes
Test route growth and rate changes before committing.

Include costs deliberately
Optional costs should be added only when the assumptions are understood.

NOTE Scenario results are planning estimates, not changes to the live dashboard configuration.

Run & Save a Scenario

Generate the comparison after checking the assumptions

The lower part of Scenario Analysis contains the remaining pay-rule rows, the Run Scenario Comparison button and saved scenario history.

Follow these steps

- 1 Finish checking the pay rules**
Confirm every band including any open-ended top band.
- 2 Run Scenario Comparison**
Generate the model only when the assumptions are ready.
- 3 Review the result**
Compare the scenario with the current position before using it for a decision.
- 4 Use saved history when required**
Saved scenarios give you a record of previous modelling.

What this page is for

- Controlled modelling**
The scenario stays separate from live settings.
- Repeatable comparisons**
Saved history helps compare different proposals.
- No accidental activation**
Running a scenario does not activate the proposed contract terms.

Contract Comparison

Compare two saved profiles without changing either one

Contract Comparison is read-only. It is designed to compare two saved contract profiles without activating them or changing live settings or historical records.

Follow these steps

- 1 Open Reports & Analysis > Contract Comparison**
Choose Contract Comparison from the Reports & analysis dropdown.
- 2 Make sure two profiles exist**
The page requires at least two saved profiles before a comparison can be built.
- 3 Select the profiles to compare**
Choose the two contracts you want to place side by side.
- 4 Review the comparison only**
Use the result for analysis; selecting a profile here does not activate it.

What this page is for

Read-only comparison

No contract is changed by opening or using this page.

Compare saved setups

Useful when considering alternative contract profiles.

Safe decision support

Historical records and live settings remain untouched.

Audit Trail

Keep a permanent record of reviewed changes

Audit Trail provides a permanent record of security events and reviewed changes. Use it to see what changed, when it changed, who made the change and the recorded reason.

Follow these steps

- 1 Open Administration > Audit Trail**
Choose Audit Trail from the Administration workspace.
- 2 Select an audit record**
Review the Audit ID, timestamp, record type, field and Changed By details.
- 3 Compare Before and After**
Where values are recorded, use the two panels to see the change clearly.
- 4 Read the change reason**
Use the recorded reason to understand why the action occurred and support later review.

What this page is for

Accountability
Reviewed changes remain attributable to a user or system action.

Traceability
Audit ID and timestamp provide a permanent reference.

Operational confidence
Useful for checking sign-ins, restores, approvals and other controlled actions.

NOTE Audit records are part of the control history. Do not treat the Audit Trail as an editable working list.

Quick Workflow - What to Use and When

A simple route through the Route Operations Dashboard for normal day-to-day work

This page is the shortest version of the guide. Use the normal workflow for everyday operations and only open the advanced tools when there is a specific reason.

1**Dashboard**

Check today's position and anything open for review.

2**Drivers**

Add or update drivers only when the driver register changes.

3**Daily Operations**

Enter who worked, routes and stops; review calculated pay.

4**Issues & Review**

Resolve exceptions before treating results as complete.

5**Reports & Analysis**

Review totals, exports and management reporting.

Advanced tools - use only when needed

- Smart Import / Customer Onboarding - when bringing new business data into the Route Operations Dashboard.
- File Mapping / Controlled Import - when a carrier file needs controlled mapping and validation.
- Recalculation - when rates or pay rules need a safe historical preview before approval.
- Scenario Analysis / Contract Comparison - for modelling and commercial decision support.
- Audit Trail - when you need to verify a reviewed change, security event or controlled action.

PUBLIC DEMO The screenshots use fictional example data. Never upload real customer or personal data to a public demo.
